* Total supply = beginning inventories + pig crop + imports

Korea's Pork Imports Grow as Increased Production Is Exported

Korea's pork production in 2002 is forecast to increase, as the country is building its herd to resume exports in the second half of 2002. Korea expects to regain FMD-free status from the Office of International Epizootics in May 2002. Korea lost its disease free status in March 2000 when FMD was reported in cattle, but no new outbreak has been reported since April 2000. Korea's pork exports in 2002 are forecast at 70,000 tons, as the prospect for regaining the FMD free status, and its subsequent eligibility to export, appear positive. Korea will likely export high-valued cuts such as fresh loins and tenderloins mainly to Japan. Korea's pork imports in 2002 are forecast at 130,000 tons, up 7 percent from 2001, driven by a strengthening economy and strong demand in popular cuts (pork bellies). Major suppliers to the Korean markets are the EU and Canada. U.S. pork exports to South Korea totaled \$22 million in 2001.
